STA 302 / 1001 H - Summer 2004
Test 1 - June 2, 2004

LAST NAME: $\qquad$ FIRST NAME: $\qquad$
STUDENT NUMBER: $\qquad$

ENROLLED IN: (circle one) STA 302 STA 1001

INSTRUCTIONS:

- Time: 60 minutes
- Aids allowed: calculator.
- A table of values from the $t$ distribution is on the last page (page 7).
- Total points: 40

## Some formulae:

$$
\begin{array}{cc}
b_{1}=\frac{\sum\left(X_{i}-\bar{X}\right)\left(Y_{i}-\bar{Y}\right)}{\sum\left(X_{i}-\bar{X}\right)^{2}} & b_{0}=\bar{Y}-b_{1} \bar{X} \\
\operatorname{Var}\left(b_{1}\right)=\frac{\sigma^{2}}{\sum\left(X_{i}-\bar{X}\right)^{2}} & \operatorname{Var}\left(b_{0}\right)=\sigma^{2}\left(\frac{1}{n}+\frac{\bar{X}^{2}}{\sum\left(X_{i}-\bar{X}\right)^{2}}\right) \\
\operatorname{Cov}\left(b_{0}, b_{1}\right)=-\frac{\sigma^{2} \bar{X}}{\sum\left(X_{i}-\bar{X}\right)^{2}} & \mathrm{SSTO}=\sum\left(Y_{i}-\bar{Y}\right)^{2} \\
\mathrm{SSE}=\sum\left(Y_{i}-\hat{Y}_{i}\right)^{2} & \mathrm{SSR}=b_{1}^{2} \sum\left(X_{i}-\bar{X}\right)^{2}=\sum\left(\hat{Y}_{i}-\bar{Y}\right)^{2} \\
\sigma^{2}\left\{\hat{Y}_{h}\right\}=\operatorname{Var}\left(\hat{Y}_{h}\right)=\sigma^{2}\left(\frac{1}{n}+\frac{\left(X_{h}-\bar{X}\right)^{2}}{\sum\left(X_{i}-\bar{X}\right)^{2}}\right) & \sigma^{2}\{\operatorname{pred}\}=\operatorname{Var}\left(Y_{h}-\hat{Y}_{h}\right)=\sigma^{2}\left(1+\frac{1}{n}+\frac{\left(X_{h}-\bar{X}\right)^{2}}{\sum\left(X_{i}-\bar{X}\right)^{2}}\right)
\end{array}
$$

Working-Hotelling coefficient: $W=\sqrt{2 F_{2, n-2 ; 1-\alpha}}$

1. (a) (2 points) Consider the simple linear regression model $Y_{i}=\beta_{0}+\beta_{1} X_{i}+\epsilon_{i}$ where the $\epsilon_{i}$ 's are independent and identically distributed with the $N\left(0, \sigma^{2}\right)$ distribution. Assume the $X_{i}$ 's are fixed. What is the distribution of $Y_{i}$ when $X_{i}$ is 10 ?
(b) (3 points) The least squares estimate of the $Y$ intercept for the model in (a) is $b_{0}$ as given on the first page. Show that $b_{0}$ is an unbiased estimate of the intercept in the model. You may take as known any results that were proved in lecture.
(c) (4 points) Show that the sum of the residuals is 0 for the least squares fit for the model above. What assumptions about the model did you use for this calculation?
2. (6 points (2 each)) For each of the following statements, say whether it is true or false. Give a brief justification of your answer.
(a) A value of $R^{2}$ close to 1 indicates that the linear regression model is a good fit to the data.
(b) The estimate of the error variance, $s^{2}$, is a random variable.
(c) $\sum_{i=1}^{n}\left(Y_{i}-\hat{Y}_{i}\right)^{2}=0$
3. Two species of predatory birds, collard flycatchers and tits, compete for nest holes during breeding season. Frequently, dead flycatchers are found in nest boxes occupied by tits. A field study examined whether the risk of mortality to flycatchers is related to the degree of competition between the two bird species for next sites. At each of 14 locations, the following data were collected: the number of flycatchers killed (the response variable labelled fc_killed) and the nest box occupancy measured as a percentage (the predictor variable labelled tit_occ).
The data and some SAS output are given below. Some numbers from the SAS output have been purposely deleted.

| Location | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| fc_killed | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 2 | 2 | 3 | 4 | 5 |
| tit_occ | 24 | 33 | 34 | 43 | 50 | 35 | 35 | 38 | 40 | 31 | 43 | 55 | 57 | 64 |

Questions pertaining to this output are on the next two pages.
(a) (5 points) What are the values of the 5 missing numbers (A through E ) in the SAS output?
(b) (5 points) For the analysis of variance $F$ test, state the null and alternative hypotheses, the value of the test statistic, the distribution of the test statistic under the null hypothesis, the $p$-value as accurately as possible, and an appropriate conclusion.
(c) (2 points) Estimate the mean change in the number of flycatchers killed when the nest box tit occupancy increases by $10 \%$.
(d) (3 points) Give a $95 \%$ confidence interval for the slope of the line.
(e) (5 points) Suppose an additional location was later found to have a nest box tit occupancy of $30 \%$. Give a $90 \%$ prediction interval for this new value.
(f) (3 marks) Would a $90 \%$ confidence interval for the mean number of flycatchers killed when the tit occupancy is $30 \%$ be wider or narrower than your interval in part (e). Explain why the width of the intervals differ. An answer that only points out the differences in the formulae will receive no marks.
(g) (2 marks) Basing your answer only on the information you have from the data and SAS output that was given, do you have any concerns about the validity of the prediction interval you found in the part (e)? Explain.
