

# Accurate directional inference for vector parameters

Nancy Reid

February 26, 2016

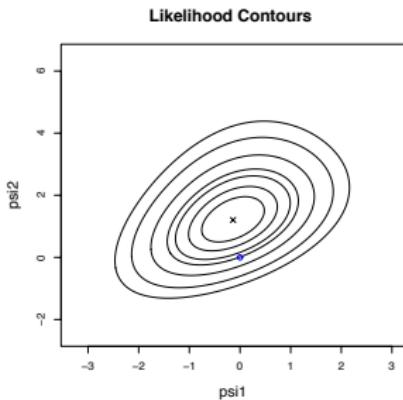

with Don Fraser, Nicola Sartori, Anthony Davison

# Parametric models and likelihood

- model  $f(y; \theta)$ ,  $\theta \in \mathbb{R}^p$
- data  $y = (y_1, \dots, y_n)$  independent observations
- log-likelihood function  $\ell(\theta; y) = \log f(y; \theta)$
- parameter of interest  $\theta = (\psi, \lambda)$ ,  $\psi \in \mathbb{R}^d$
- likelihood inference

$$w(\psi) = 2\{\ell(\hat{\psi}, \hat{\lambda}) - \ell(\psi, \hat{\lambda}_\psi)\} \sim \chi_d^2$$

$$w_B(\psi) = \frac{w(\psi)}{1 + B(\psi)} \sim \chi_d^2 \quad O_p(n^{-2})$$

$$B(\psi) = E\{w(\psi)\}/d$$

$$w^*(\psi) = w(\psi) \left\{ 1 - \frac{\log \gamma(\psi)}{w(\psi)} \right\}$$

Skovgaard, 2001

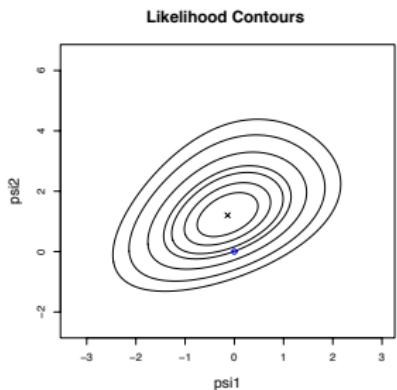

# Example: $2 \times 3$ contingency table

- activity amongst psychiatric patients Everitt, 1992

	Affective disorders	Schizophrenics	Neurotics
Retarded	12	13	5
Not retarded	18	17	25

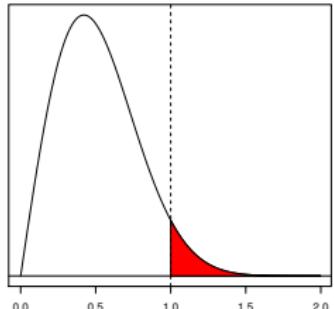

- model: log-linear  $y \sim \text{Poisson}$ ,  $\log\{E(y)\} = X\theta$ ,  $\theta \in \mathbb{R}^6$
- log-likelihood  $\ell(\theta; y) = \theta'X'y - 1'e^{X\theta} = \theta's - c(\theta)$
- $\theta = (\psi, \lambda)$   $\psi \in \mathbb{R}^2, \lambda \in \mathbb{R}^4$
- $(\psi_1, \psi_2)$  interaction parameters
- $H_0 : \psi = \psi_0 = (0, 0)$  independence
- log-likelihood  $\ell(\psi, \lambda; y) = \psi's_1 + \lambda's_2 - c(\psi, \lambda)$

# Testing $\psi = 0$

$w(\psi_0) \sim \chi^2_2 \quad p\text{-value } 0.047$

$w^*(\psi_0) \quad p\text{-value } 0.048$

directional  $p\text{-value } 0.050$

exact  $p\text{-value } 0.051$

# Linear exponential families

- model  $f(y; \theta) = \exp\{\varphi(\theta)^T u(y) - c\{\varphi(\theta)\} - d(y)\}$   $y_1, \dots, y_n$  i.i.d

- sufficient statistic

$$f(s; \theta) = \int_{\{y: s(y)=s\}} f(y; \theta) dy = \exp\{\varphi(\theta)^T s - nc\{\varphi(\theta)\} - \tilde{d}(s)\}$$

- reduce dimension from  $n$  to  $p$  by marginalization

- linear parameter of interest  $\varphi(\theta) = \theta = (\psi, \lambda)$

- model  $f(s_1, s_2; \psi, \lambda) = \exp\{\psi^T s_1 + \lambda^T s_2 - nc(\psi, \lambda) - \tilde{d}(s)\}$

- conditional density  $f(s_1 | s_2; \psi) = \exp\{\psi^T s_1 - n\tilde{c}_2(\psi) - \tilde{d}_2(s_1)\}$

- reduce dimension from  $p$  to  $d$  by conditioning

# ... conditional density

- $f(s_1 | s_2; \psi) = \exp\{\psi^T s_1 - n\tilde{c}_2(\psi) - \tilde{d}_2(s_1)\}$
- $f(s_1 | s_2; \psi) = \frac{f(s_1, s_2; \psi, \lambda)}{f(s_2; \psi, \lambda)} \propto f(s; \psi, \lambda)$  with  $s_2$  held fixed
- $s_2$  held fixed  $\iff \hat{\lambda}_\psi$  held fixed  $(\hat{\theta}_\psi = (\psi, \hat{\lambda}_\psi))$
- saddlepoint approximation:  

$$f(s_1 | s_2; \psi) \doteq c \exp[\ell(\hat{\theta}_\psi^0; s) - \ell\{\hat{\theta}(s); s\}] |j\{\hat{\theta}(s); s\}|^{-1/2}, \quad s \in L_\psi^0$$
- centering  $\ell(\theta; s) = \psi^T s_1 + \lambda^T s_2 + \ell(\theta; y^0)$  fix  $s^0 = s(y^0) = 0$
- plane  $L_\psi^0 = \{s \in \mathbb{R}^p : s_2 = 0\} = \{s \in \mathbb{R}^p : \hat{\lambda}_\psi = \hat{\lambda}_\psi^0\}$
- $\hat{\theta}(s) : \partial \ell(\theta; s) / \partial \theta = 0$  m.l.e. as a function of the variable

# ... conditional density

$$f(s_1 \mid s_2; \psi) \doteq c \exp[\ell(\hat{\theta}_\psi^0; s) - \ell(\hat{\theta}(s); s)] |j(\hat{\theta}(s); s)|^{-1/2}, \quad s \in L_\psi^0$$

	Affective disorders	Schizophrenics	Neurotics
Retarded	12	13	5
Not retarded	18	17	25

$$\textcolor{red}{s}_1 \in \mathbb{R}^2, s_2 \in \mathbb{R}^4$$

$L_\psi^0$ : all  $2 \times 3$  tables with the same row and column totals

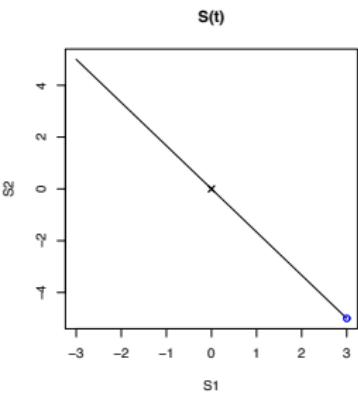

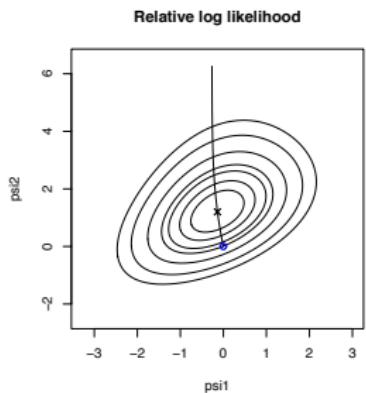

# Directional tests

- measure the directed departure from  $H_0$  in  $L_\psi^0$
- $s_\psi$ : expected value of  $s_1$ , under  $H_0$
- $s^0$ : observed value of  $s_1$  = 0 from centering
- $L_\psi^*$ : line through these two points
- $L_\psi^* = ts^0 + (1 - t)(s_\psi - s^0)$ ,  $t \in \mathbb{R}$

... directional tests

$$L_{\psi}^* = ts^0 + (1-t)\mathbf{s}_{\psi}$$

- null hypothesis of independence  $t = 0$
- ✗ observed value of  $s$   $t = 1$

$p$ -value compares probability from  $\times$  to  $\infty$  to that from ○ to  $\infty$   
along the line in the sample space curve in the parameter space

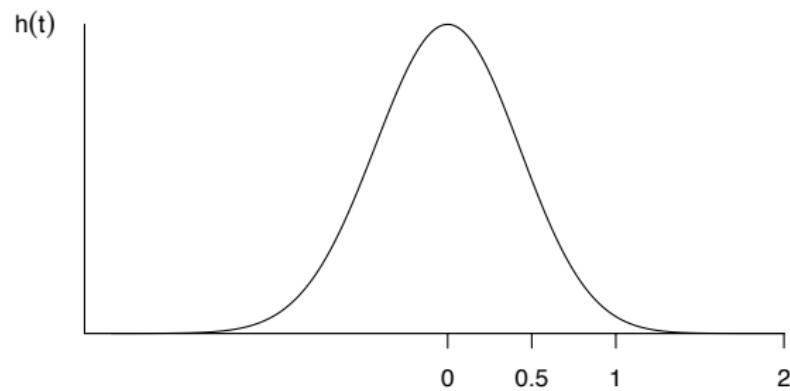

like a 2-sided  $p$ -value  $\Pr(\text{response} > \text{observed} \mid \text{response} > 0)$

# ... directional $p$ -value

- $p$ -value =  $\frac{\int_1^\infty t^{d-1} f\{s(t); \psi\} dt}{\int_0^\infty t^{d-1} f\{s(t); \psi\} dt}$   $s(t)$  along the line  $L_\psi^*$
- $t^{d-1}$  from change to polar coordinates  $||s||$ , conditional on  $s/||s||$
- Simplifications:
  - 1:  $L_\psi^* \subset L_\psi^0 \subset \mathbb{R}^p$
  - 2: ratio of two integrals – drop any terms that don't depend on  $t$
  - 3: saddlepoint approximation

$$f(s; \psi) \doteq c \exp[\ell(\hat{\theta}_\psi^0; s) - \ell(\hat{\theta}(s); s)] |j(\hat{\theta}(s); s)|^{-1/2}, \quad s \in L_\psi^0$$

# $2 \times 3$ table

# Simulations

3 groups, 5 observations per group

# Simulations

1000 groups, 5 observations per group

dimension  $\psi$  999; dimension nuisance 1001

# Example: covariance selection

- model  $y_i \sim N_q(\mu, \Lambda^{-1})$  inverse covariance matrix

- linear exponential family

$$\ell(\theta; y) = \frac{n}{2} \log |\Lambda| - \frac{1}{2} \text{tr}(\Lambda \mathbf{y}^T \mathbf{y}) + \mathbf{1}^T \mathbf{y} \xi - \frac{n}{2} \xi^T \Lambda \xi \quad \mathbf{s}_1, \mathbf{s}_2$$

- $\theta = (\xi, \Lambda) = (\Lambda\mu, \Lambda)$

- $H_0$ : some off-diagonal elements of  $\Lambda$  are 0     $\psi_1 = \dots = \psi_d = 0$   
conditional independence

- need constrained m.l.e: use `fitConGraph` in `ggm`

- $\hat{\Lambda}^{-1}(t) = t\hat{\Lambda}^{-1} + (1-t)\hat{\Lambda}_0^{-1}$  m.l.e. along the line

- $f\{s(t); \psi\} \propto |t\hat{\Lambda}^{-1} + (1-t)\hat{\Lambda}_0^{-1}|^{(n-q-2)/2}$

## ... covariance selection

Covariance matrix  $11 \times 11$ ; dimension of  $\psi = 45$ 

first order Markov dependence

# Tangent exponential model

$n \downarrow p$  (dimension of  $y$  to dimension of  $\theta$ )

- Every model  $f(y; \theta)$  on  $\mathbb{R}^n$  can be approximated by an exponential family model:

$$f_{TEM}(s; \theta)ds = \exp\{\varphi(\theta)'s + \ell(\theta)\}h(s)ds$$

- $s$  is a score variable on  $\mathbb{R}^p$
  - $\ell(\theta) = \ell(\theta; y^0)$  is the observed log-likelihood function
  - $\varphi(\theta) = \varphi(\theta; y^0)$  is the canonical parameter  $\in \mathbb{R}^p$
  - matches log-likelihood function at  $y^0$ , and its first derivative on the sample space, at  $y^0$
  - implements conditioning on an approximate ancillary statistic
- $s(y) = -\ell_\varphi(\hat{\theta}^0; y)$
- to be described
- by construction
- contrast with exp fam

## Aside: canonical parameter $\varphi(\theta)$

- if  $f(y; \theta)$  is an exponential family,  $\varphi$  is sitting in the model
- if not find a **pivotal quantity**  $z_i = z_i(y_i; \theta)$  with a fixed distribution  
example:  $(y_i - \mu)/\sigma$
- define  $V_i = - \left( \frac{\partial z_i}{\partial y_i} \right)^{-1} \frac{\partial z_i}{\partial \theta} \Big|_{y=y^0, \theta=\hat{\theta}^0}$   
a vector of length  $p$

$$\varphi(\theta) = \varphi(\theta; y^0) = \sum_{i=1}^n \frac{\partial \ell(\theta; y^0)}{\partial y_i} V_i = \ell_{;V}(\theta; y^0)$$

# Testing a value for $\psi$

eliminating nuisance parameter:  $p \downarrow d$

- $\theta = (\psi, \lambda)$ ;  $\varphi = \varphi(\theta)$  is the canonical parameter of the TEM
- with  $\psi$  fixed by the hypothesis, we can integrate out the nuisance parameter by **Laplace approximation**
- define the same plane in the score space  $L_\psi^0$ , where  $\hat{\varphi}_\psi$  is fixed at its observed value

$$f(s; \psi) = c \exp\{\ell(\hat{\varphi}_\psi^0; s) - \ell(\hat{\varphi}(s); s)\} |j_{\varphi\varphi}(\hat{\varphi}(s); s)|^{-1/2} |j_{(\lambda\lambda)}(\hat{\varphi}_\psi^0; s)|^{1/2},$$

$$s \in L_\psi^0$$

$$p\text{-value} = \frac{\int_1^\infty t^{d-1} f\{s(t); \psi\} dt}{\int_0^\infty t^{d-1} f\{s(t); \psi\} dt}$$

$s(t)$  along the line  $L_\psi^*$

# Example: marginal independence

- $y_i \sim N_q(\mu, \Sigma)$ ,  $H_0$ : some entries of  $\Sigma$  are 0
- estimate  $\Sigma$  under  $H_0$  using `fitCovGraph`
- $\ell(\Sigma) = \frac{n-1}{2}[\log |\varphi(\Sigma)| - \frac{n-1}{2}\text{tr } \{\varphi(\Sigma)S\}]$ ,  $\varphi(\Sigma) = \Sigma^{-1}$   
 $S = \text{sample covariance}$
- $f\{s(t); \psi\} \propto |t\hat{\Sigma} + (1-t)\hat{\Sigma}_0|^{(n-q-2)/2} |j_{(\lambda\lambda)}\{\hat{\Sigma}_0; s(t)\}|^{1/2}$
- $j_{(\lambda\lambda)}$  needs  $\partial\ell(\Sigma)/\partial(\sigma_{jk})$  for the non-zero elements
- $j_{\lambda_j\lambda_k}\{\hat{\Sigma}_0; s(t)\} = \frac{n-1}{2} \left( \text{tr}(A_{kj} + t \left[ \text{tr}\{(A_{kj} + A_{jk})(\hat{\Sigma}_0^{-1}\hat{\Sigma} - I_q)\} \right]) \right)$
- $A_{kj} = \Sigma_0^{-1}(\partial\Sigma/\partial\lambda_k)\Sigma_0^{-1}(\partial\Sigma/\partial\lambda_j)$

# Conclusion

- different way to assess vector parameters
- incorporates information in the direction of departure
- easy to compute: two model fits, plus 1-d numerical integration
- accurate conditionally, by construction, and unconditionally
  - simulations
- can be used in models of practical interest
- exponential family model not necessary – easily generalized using approximate exponential family model
