Composite likelihood

- ▶ Vector observation: $Y \sim f(y; \theta)$, $Y \in \mathcal{Y} \subset \mathbb{R}^m$, $\theta \in \mathbb{R}^d$
- ▶ Set of events: $\{\mathcal{A}_k, k \in K\}$
- ▶ Composite Likelihood: (Lindsay, 1988)

$$CL(\theta; y) = \prod_{k \in K} L_k(\theta; y)^{w_k}$$

- ▶ $L_k(\theta; y) = f(\{y \in \mathcal{A}_k\}; \theta)$ likelihood for an event
- ▶ $\{w_k, k \in K\}$ a set of weights

Composite likelihood

- ▶ Vector observation: $Y \sim f(y; \theta)$, $Y \in \mathcal{Y} \subset \mathbb{R}^m$, $\theta \in \mathbb{R}^d$
- ▶ Set of events: $\{\mathcal{A}_k, k \in K\}$ $L_k(\theta; y) = f(y \in \mathcal{A}_k; \theta)$
- ▶ Composite Likelihood: (Lindsay, 1988)

$$CL(\theta; y) = \prod_{k \in K} L_k(\theta; y)^{w_k}$$

- ▶ $L_k(\theta; y) = f(\{y \in \mathcal{A}_k\}; \theta)$ likelihood for an event
- ▶ $\{w_k, k \in K\}$ a set of weights

Examples

1975

- Composite Conditional Likelihood: (Besag, 1974)

$$\mathcal{L}_C(\theta; y) = \prod_{s \in S} f_{s|S^c}(y_s | y_{S^c})^{w_s},$$

Hammersley - Clifford

and variants by modifying events

- Composite Marginal Likelihood:

$$CML(\theta; y) = \prod_{s \in S} f_s(y_s; \theta)^{w_s},$$

$f_s(y_s; \theta)$: marginal density of the subvector y_s induced by f

- Independence Likelihood:

$$\prod_{j=1}^m f_1(y_j; \theta)$$

- Pairwise Likelihood:

$$\prod_{r=1}^m \sum_{s>r} f_2(y_r, y_s; \theta)$$

Derived quantities

log composite likelihood: $\text{cl}(\theta; y) = \log CL(\theta; y)$

► score function: $U(\theta; y) = \nabla_{\theta} \text{cl}(\theta; y) = \sum_{s \in S} w_s U_s(\theta; y)$

►

$$U_s(\theta; y) = \nabla_{\theta} f_s(y_s; \theta)$$

► variability matrix: $J(\theta) = \text{var}_{\theta}\{U(\theta; Y)\}$

► sensitivity matrix: $H(\theta) = E_{\theta}\{-\nabla_{\theta} U(\theta; Y)\}$

► Godambe information (or sandwich information):

$$G(\theta) = H(\theta)J(\theta)^{-1}H(\theta)$$

Derived quantities $y \sim f(y; \theta) \quad y \in \mathbb{R}^m$

log composite likelihood: $\text{cl}(\theta; y) = \log CL(\theta; y)$

score function: $U(\theta; y) = \nabla_{\theta} \text{cl}(\theta; y) = \sum_{s \in S} w_s U_s(\theta; y)$

- ▶ weighted pairwise composite likelihood

$$\mathcal{L}_{pair}(\beta) = \prod_{i=1}^n \frac{1}{m_i - 1} \prod_{r=1}^{m_i} \prod_{s=r+1}^{m_i} f(y_{ir}, y_{is}; \beta)$$

- ▶ weights chosen so that $\mathcal{L}_{pair} = \text{full likelihood if } \rho = 0$

Henderson & Shimura, 2003

Estimating functions

- ▶ Suppose $y = (y_1, \dots, y_n)$ are i.i.d. from density $f(y; \theta)$, and $g(y_i, \theta)$ is a function from $\mathbb{R} \times \mathbb{R}$ to \mathbb{R} , satisfying

$$\mathbb{E}\{g(y_i, \theta)\} = 0$$

- ▶ examples:
- ▶ define an estimator of θ by

$$\sum_{i=1}^n g(y_i, \tilde{\theta}_g) = 0$$

- ▶ under smoothness conditions on g and f , etc., we have

$$\sqrt{n}(\tilde{\theta}_g - \theta) \xrightarrow{\mathcal{L}} N\{0, G^{-1}(\theta)\}, \quad G^{-1}(\theta) = H(\theta)J^{-1}(\theta)H(\theta)$$

- ▶ $H(\theta) = -\mathbb{E}\{\nabla_\theta g(y_1, \theta)\}$, $J(\theta) = \text{var}\{g(y_1, \theta)\}$
- ▶ composite likelihood a particular example of this

Estimating functions

- ▶ Suppose $y = (y_1, \dots, y_n)$ are i.i.d. from density $f(y; \theta)$, and $g(y_i, \theta)$ is a function from $\mathbb{R} \times \mathbb{R}$ to \mathbb{R} , satisfying

$$\mathbb{E}\{g(y_i, \theta)\} = 0 \quad g(y, \mu)$$

- ▶ examples: $y_i - E(y_i)$
 - ▶ define an estimator of θ by
- $$1(y_i < \mu_i) = \begin{cases} -a & \text{o.w.} \\ y_i - \mu_i, & |y_i - \mu| < a \\ +a & \text{o.w.} \end{cases}$$
- if f symm.

$$\sum_{i=1}^n g(y_i, \tilde{\theta}_g) = 0$$

- ▶ under smoothness conditions on g and f , etc., we have

$$\sqrt{n}(\tilde{\theta}_g - \theta) \xrightarrow{\mathcal{L}} N\{0, G^{-1}(\theta)\}, \quad G^{-1}(\theta) = H(\theta)J^{-1}(\theta)H(\theta)$$

- ▶ $H(\theta) = -\mathbb{E}\{\nabla_\theta g(y_1, \theta)\}, \quad J(\theta) = \text{var}\{g(y_1, \theta)\}$
- ▶ composite likelihood a particular example of this

Estimating functions

- Suppose $y = (y_1, \dots, y_n)$ are i.i.d. from density $f(y; \theta)$, and $g(y_i, \theta)$ is a function from $\mathbb{R} \times \mathbb{R}$ to \mathbb{R} , satisfying

$$\underbrace{\mathbb{E}\{g(y_i, \theta)\} = 0}_{+ \text{ smoothness}}$$

- examples:
- define an estimator of θ by

$$\sum_{i=1}^n g(y_i, \tilde{\theta}_g) = 0$$

- under smoothness conditions on g and f , etc., we have

$$\sqrt{n}(\tilde{\theta}_g - \theta) \xrightarrow{\mathcal{L}} N\{0, G^{-1}(\theta)\}, \quad G^{-1}(\theta) = H(\theta)J^{-1}(\theta)H(\theta)$$

- $H(\theta) = -\mathbb{E}\{\nabla_\theta g(y_1, \theta)\}, \quad J(\theta) = \text{var}\{g(y_1, \theta)\}$
- composite likelihood a particular example of this

SM 7.3

... estimating functions

- ▶ an **optimal** estimating function maximizes $G(\theta)$, or minimizes $G^{-1}(\theta)$ in a class of unbiased estimating functions
- ▶ suppose now that we assume instead Y_i independent, and

$$\mathbb{E}(y_i; \theta) = \mu_i(\theta), \quad \text{var}(y_i; \theta) = V_i(\theta)$$

- ▶ define $g(\underline{y}, \theta)$ by

$$\sum_{i=1}^n w_i(\theta) \{y_i - \mu_i(\theta)\}$$

- ▶ $G(\theta)$ is maximized if

$$w_i(\theta) \propto \frac{\mu'_i(\theta)}{V_i(\theta)}$$

... estimating functions

- ▶ an optimal estimating function maximizes $G(\theta)$, or minimizes $G^{-1}(\theta)$ in a class of unbiased estimating functions
- ▶ suppose now that we assume instead Y_i independent, and

$$E(y_i; \theta) = \mu_i(\theta), \quad \text{var}(y_i; \theta) = V_i(\theta)$$

- ▶ define $g(\underline{y}, \theta)$ by

$$\sum_{i=1}^n w_i(\theta) \{\tilde{y}_i - \tilde{\mu}_i(\theta)\} = 0$$

- ▶ $G(\theta)$ is maximized if

$$w_i(\theta) \propto \frac{\mu'_i(\theta)}{V_i(\theta)}$$

... estimating functions

- ▶ an **optimal** estimating function maximizes $G(\theta)$, or minimizes $G^{-1}(\theta)$ in a class of unbiased estimating functions
- ▶ suppose now that we assume instead Y_i independent, and

$$E(y_i; \theta) = \mu_i(\theta), \quad \text{var}(y_i; \theta) = V_i(\theta)$$
